CA-IF1042Lx ±42V Fault Protected CAN Transceiver with CAN FD

1. Features

- **Meets the ISO 11898-2:2016 and ISO 11898-5:2007 physical layer standards**
- **'Turbo' CAN:**
  - Support classic CAN and 5 Mbps CAN FD (flexible data rate)
  - Short and symmetrical propagation delay time and fast loop time for enhanced timing margin
  - Higher data rate in loaded CAN networks
- **Ideal passive behavior when unpowered**
  - Bus and logic terminals are high impedance (no load)
  - Power up/down with glitch free operation on bus and RXD output
- **Integrated protection increases robustness**
  - ±42V fault-tolerant CANH and CANL
  - ±30V extended common-mode input range (CMR)
  - Undervoltage protection on V_{CC} and V_{IO} supply terminals
  - Transmitter dominant timeout prevents lockup, data rates down to 4 kbps
  - Thermal shutdown
- **Typical loop delay: 155ns**
- **3.0V to 5.5V Logic-Supply (V_{IO}) Range (CA-IF1042LVS-Q1 only)**
- **–55°C to 150°C Junction Temperatures Range**
- **Available in SOIC8**
- **AEC Q-100 qualified for automotive applications**

2. Applications

- Body electronics and lighting
- Automotive gateway
- Advanced driver assistance systems (ADAS)
- Infotainment and cluster
- Hybrid, electric & powertrain systems
- Personal transport vehicles - Electric bike
- Industrial control

3. General Description

The CA-IF1042Lx devices are control area network (CAN) transceivers with integrated protection for industrial and automotive applications. These devices are designed for using in CAN FD networks up to 5 Mbps and feature ±42V extended fault protection on the CAN bus for equipment where overvoltage protection is required. This family of CAN transceivers also incorporate an input common-mode range(CMR) of ±30V, exceeding the ISO 11898 specification of -2V to +7V, well suited for applications where ground planes from different systems are shifting relative to each other.

The CA-IF1042Lx series devices include a dominant timeout to prevent bus lockup caused by controller error or by a fault on the TXD input. When the TXD remains in the dominant state (low) for longer than t_{DOM}, the driver is switched to the recessive state, releasing the bus and allowing other nodes to communicate. The transceivers feature a STB pin for two modes of operation: normal high-speed mode and standby mode for low current consumption.

The CA-IF1042Lx family of devices is available in a standard 8-pin narrow-body SOIC package, operates over the -55°C to +150°C junction temperature range.

Device Information

Part number	Package	Package size(NOM)
CA-IF1042LS-Q1	SOIC8	4.9mm x 3.9mm
CA-IF1042LVS-Q1

5. Revision History

Revision Number	Description	Page Changed
V1.0	Initial Version	N/A
V1.1	Update the maximum voltage range of AN bus IO from ± 40V to ± 42V	P1, P5, P16, P18

6. Pin Configuration and Functions

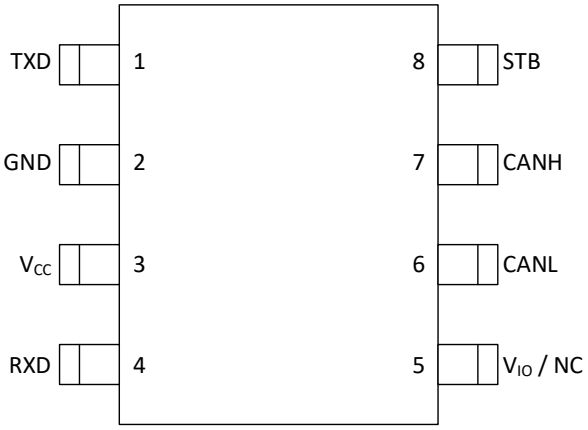

Figure 6-1 CA-IF1042Lx Pin Configuration

Table 6-1 CA-IF1042Lx Pin Configuration and Description

Pin #		Pin Name	Type	Description
CA-IF1042LS-Q1	CA-IF1042LVS-Q1			
1	1	TXD	Digital I/O	Transmit Data Input, Drive TXD high to set the driver in the recessive state. Drive TXD low to set the driver in the dominant state. TXD is a CMOS/TTL compatible input from a CAN controller with an internal pull-up to V_{CC}[1]
2	2	GND	GND	Ground.
3	3	V_{CC}	Power	+5V Supply Voltage. Bypass V_{CC} to GND with an at least 0.1μF capacitor.
4	4	RXD	Digital I/O	Receive Data Output, RXD is LOW for dominant bus state and HIGH for recessive bus state. RXD is a CMOS/TTL compatible output from the physical bus lines CANH and CANL.
5	-	NC	NC	No connect.
-	5	V_{IO}	Power	Logic Supply Input. V_{IO} is the logic supply voltage for the input/output between the CAN transceiver and controller. V_{IO} allows full compatibility from +3.0V to +5.5V logic on all digital lines. Bypass to GND with a 0.1μF capacitor. Connect V_{IO} to V_{CC} for 5V logic compatibility.
6	6	CANL	Bus I/O	CAN bus line low.
7	7	CANH	Bus I/O	CAN bus line high.
8	8	STB	Digital I/O	Standby Mode. A logic-high on STB pin or leave it open to select the standby mode. In standby mode, the transceiver is not able to transmit data and the receiver is in low-power mode. A logic-low on STB pin puts the transceiver in normal operating mode.

Note:

1. The reference voltage of CA-IF1024LS-Q1 is V_{CC}.The reference voltage of CA-IF1024LVS-Q1 is V_{IO}.

7. Specifications

7.1. Absolute Maximum Ratings

PARAMETER		MIN	MAX	UNIT
V_{CC}	5V Bus Supply Voltage Range	-0.3	7	V
V_{IO}	Logic Supply Voltage Range	-0.3	7	V
V_{BUS}	CAN Bus I/O voltage range (CANH,CANL)	-42	42	V
$V_{(DIFF)}$	Max differential voltage between CANH and CANL	-42	42	V
$V_{(Logic\_Input)}$	Logic input terminal voltage range (TXD, S)	-0.3	V_{IO}+0.3 and <+7	V
$V_{(Logic\_Output)}$	Logic output terminal voltage range (RXD)	-0.3	V_{IO}+0.3 and <+7	V
$I_{O(RXD)}$	RXD (receiver) terminal output current	-8	8	mA
T_J	Virtual junction temperature range	-55	150	℃
T_{STG}	Storage temperature range	-65	150	℃

Note:

1. The stresses listed under "Absolute Maximum Ratings" are stress ratings only, not for functional operation condition. Exposure to absolute maximum rating conditions for extended periods may cause permanent damage to the device.

7.2. ESD Ratings

Parameters	TEST CONDITIONS		VALUE	UNIT
CA-IF1042Lx				
HBM[1] ESD	CAN bus terminals (CANH, CANL) to GND		±6000	V
	Other pins		±6000	
CDM ESD	All pins		±2000	V
System Level ESD	CAN bus terminals (CANH, CANL) to GND	IEC 61000-4-2: unpowered contact discharge.	±6000	V

Note:

1. Per JEDEC document JEP155, 500V HBM allows safe manufacturing of standard ESD control process.

7.3. Recommended Operating Conditions

PARAMETER		MIN	TYP	MAX	UNIT
V_{CC}	Supply Voltage Range	4.5		5.5	V
V_{IO}	Logic Supply Voltage Range	3.0		5.5	V
$I_{OH(RXD)}$	RXD terminal high level output current	-2			mA
$I_{OL(RXD)}$	RXD terminal low level output current			2	mA

7.4. Thermal Information

Thermal Metric		SOIC8	UNIT
$R_{\theta JA}$	Junction to Ambient	170	°C/W
$R_{\theta JC(top)}$	Junction to Case (top)	40	°C/W

7.5. Electrical Characteristics

Over recommended operating conditions, T_A = –40°C to 125°C (unless otherwise noted).

9. Detailed Description

The CA-IF1042Lx family of devices is fault-protected Controller Area Network (CAN) transceiver, meets the ISO11898-2 (2016) high speed CAN physical layer standard. These devices are designed for harsh industrial and automotive applications with a number of integrated robust protection features set that improve the reliability of end equipment. All devices are fault protected up to ±42V for the bus pins, making them ideal for applications where overvoltage protection is required. A common-mode voltage range of ±30V enables communication in noisy environments where there are ground plane differences between different systems. Dominant timeout prevents the bus from being blocked by a hung-up microcontroller, and the outputs CANH and CANL are short-circuit current-limited and protected against excessive power dissipation by thermal shutdown circuitry that places the driver outputs in a high-impedance state.

A separate input V_{IO} allows the CA-IF1042LVx devices to communicate with logic systems down to 3.0V while operating up to a +5.5V bus supply. This provides a reduced input voltage threshold to the TXD and STB inputs, and provides a logic-high output at RXD compatible with the microcontroller's supply rail. The logic compatibility eliminates external logic level translator and longer propagation delay due to level shifting. Connect V_{IO} to V_{CC} to operate with +5V logic systems.

The CA-IF1042Lx devices can operate up to 5Mbps data rate and support CAN FD. However, the maximum data rate is limited by the bus loading, number of nodes, cable length etc. factors, for CAN network design, margin must be given for signal loss across the system and cabling, parasitic loadings, timing, network imbalances, ground offsets and signal integrity thus a practical maximum data rate, number of nodes often lower than the theoretical value.

9.1. CAN Bus Status

The CAN bus has two states: dominant and recessive. In the dominant state (a zero bit, used to determine message priority), CANH-CANL are defined to be logic ‘0’ when the voltage across them is between +1.5V and +3V (higher than 0.9V). In the recessive state (a 1-bit and the state of the idle bus), the driver is defined to be logic ‘1’ when differential voltage is between -120mV and +12mV, or when it is near zero(lower than 0.5V), see *Figure 9-1* for the bus logic state voltage definition.

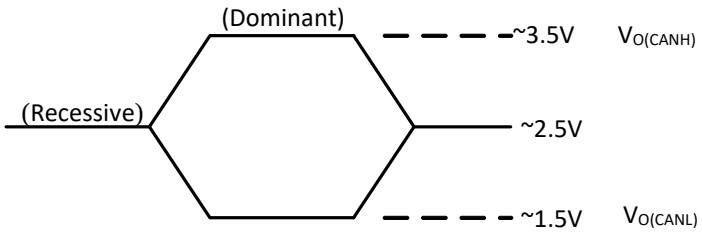

Figure. 9-1 Bus Logic State Voltage Definition

9.2. Receiver

The receiver of CA-IF1042Lx family of devices includes a main receiver to support normal bi-directional communication and a low-power receive channel to monitor the bus line and detect the wakeup event on the bus line during standby mode. In normal operation (STB = low), the main receiver reads the differential input from the bus line (CANH and CANL) and transfers this data as a single-ended output RXD to the CAN controller. The internal comparator senses the difference voltage V_{DIFF} = (V_{CANH}-V_{CANL}), with respect to an internal threshold of 0.7V. If V_{DIFF} > 0.9V, a logic-low is present on RXD; If V_{DIFF} < 0.5V, a logic-high is present. The CANH and CANL common-mode range is ±30V in normal mode. See *Figure 9-2* for the receiver input bias circuit.

Drive the STB pin high or leave it open for standby mode, in this case, the main receiver is disabled and the low-power receive channel is enabled. This switches the receiver to a low current and low-speed state. The bus line is monitored by a low-power differential comparator to detect and recognize a wakeup event on the bus line. RXD is logic High until a valid wake-up is received. Once a valid remote wake-up event occurred, RXD transition to logic Low.

RXD is a logic-high when CANH and CANL are shorted or terminated and un-driven in both normal mode and standby mode, see *Table 9-1* for more details about the receiver truth table.

Table 9-1 Receiver Truth Table

DEVICE MODE	$V_{ID} = V_{CANH}-V_{CANL}$	BUS STATE	RXD
Normal STB = Low	$V_{ID} \geq 0.9V$	Dominant	Low
	$0.5V < V_{ID} < 0.9V$	Indeterminate	Indeterminate
	$V_{ID} \leq 0.5V$	Recessive	High
Standby STB = High or open	$V_{ID} > 1.15V$	Dominant	Low if a remote wake event occurred, otherwise output High.
	$0.4V < V_{ID} < 1.15V$	Indeterminate	Indeterminate
	$V_{ID} \leq 0.4V$	Recessive	High
Any	Open ($V_{ID} \approx 0V$)	Open	High

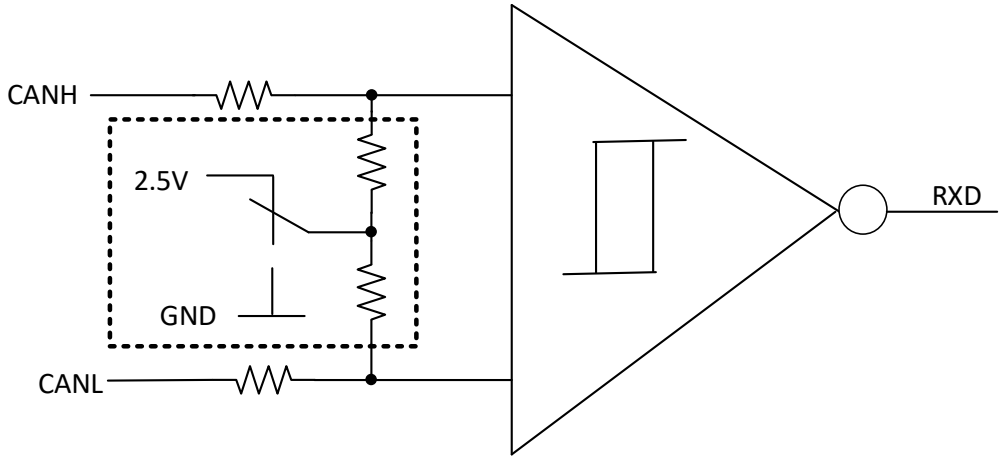

Figure. 9-2 Receiver Input/Transmitter Output Bias Circuit

9.3. Transmitter

In normal operation (STB = Low), the transmitter converts a single-ended input signal (TXD) from the local CAN controller to differential outputs for the bus lines CANH and CANL. The truth table for the transmitter is provided in *Table 9-2*. The CA-IF1042Lx family of devices protects the transmitter output stage against a short-circuit to a positive or negative voltage by limiting the driver current. Thermal shutdown further protects the devices from excessive temperatures that may result from a short circuit. The transmitter returns to normal operation once the short is removed and the junction temperature drops at least the thermal shutdown hysteresis temperature below the thermal shutdown temperature of the device.

Drive the STB pin high for standby mode, the transmitter is disabled and put the bus in high-impedance with internal weak pull-down to ground, see *Figure 9-2*.

Table 9-2 Transmitter Truth Table (When Not Connected to the Bus)

INPUT		TXD LOW TIME	OUTPUT		BUS STATE
STB	TXD		CANH	CANL	
Low	Low	$< t_{DOM}$	High	Low	Dominant
	Low	$> t_{DOM}$	$V_{CC}/2$	$V_{CC}/2$	Recessive
	High or Open	X	$V_{CC}/2$	$V_{CC}/2$	Recessive
High or Open	X	X	High-Z	High-Z	Weak pull-down to GND

X = Don't care

9.4. Protection Functions

9.4.1. Undervoltage Lockout

The CA-IF1042LVx devices have undervoltage detection on V_{CC} supply terminal, the CA-IF1042LVS-Q1 devices also feature undervoltage detection on V_{IO} supply terminal, that place the device in protected mode during an undervoltage event on V_{CC} or/and V_{IO}, see *Table 9-3* and Table 9-4.

For the CA-IF1042LS-Q1, if the supply voltage V_{CC} is less than V_{UN_VCC}, will put the device into protected state and leave the bus in high-impedance as shown in *Table 9-3*. Once an undervoltage condition is cleared on V_{CC} and the supply voltage has returned to a valid level, the devices transition to normal mode after the t_{ONTXD} time has expired. The host controller should not attempt to send or receive messages until the t_{ONTXD} time has expired.

Table 9-3 CA-IF1042LS-Q1 Undervoltage Lockout

V_{CC}	DEVICE STATE	BUS OUTPUT	RXD
> V_{uv_vcc}	STB=V_{CC}， Standby	Weak pull-down to GND	High until valid wake-up is received
	STB=V_{CC}， Normal	Per TXD	Mirrors Bus
<V_{uv_vcc} & >$V_{uv\_vcc\_sd}$	STB=V_{CC}， Standby	Weak pull-down to GND	High until valid wake-up is received
	STB=V_{CC}， Protected mode	Weak pull-down to GND	Recessive
< $V_{uv\_vcc\_sd}$	Protected mode	High Impedance	High Impedance

For the CA-IF1042LVS-Q1 devices, see *Table 9-4* for the undervoltage lockout status. Once the undervoltage condition is cleared and the supply voltage has returned to a valid level, the devices transition to normal mode after the t_{MODE} time has expired. The host controller should not attempt to send or receive messages until the t_{MODE} time has expired.

Table 9-4 CA-IF1042LV-Q1 Undervoltage Lockout

V_{CC}	V_{IO}	DEVICE STATE	BUS OUTPUT	RXD
> V_{UV_VCC}	> V_{UV_IO}	Standby (STB = high)	Weak pull-down to GND	High until valid wake-up is received
		Normal (STB = low)	Per TXD	Mirrors Bus
< V_{UV_VCC}	> V_{UV_IO}	Standby (STB = high)	Weak pull-down to GND	High until valid wake-up is received
		Protected mode (STB = low)	Weak pull-down to GND	Recessive
X[1]	< V_{UV_IO}	Protected mode	High Impedance	High Impedance

X = Don't care

9.4.2. Fault Protection

The CA-IF1042Lx devices has an internal ±42V overvoltage protection circuit on the driver output and receiver input to protect the devices from accidental shorts between a local power supply and the data lines of the transceivers. This level of protection is present whether the transceiver is powered or un-powered.

9.4.3. Thermal Shutdown

If the junction temperature of the devices exceeds the thermal shutdown threshold T_{TSD} (185°C), the device turns off the CAN driver circuits thus blocking the TXD-to-bus transmission path. The CAN bus terminals are biased to the recessive level during a thermal shutdown, and the receiver-to-RXD path remains operational. The shutdown condition is cleared when the junction temperature drops at least the thermal shutdown hysteresis temperature below the thermal shutdown threshold.

9.4.4. Current-Limit

The CA-IF1042Lx protect the transmitter output stage against a short-circuit to a positive or negative voltage by limiting the driver current. However, this will cause large supply current and dissipation. Thermal shutdown further protects the devices from excessive temperatures that may result from a short circuit. The transmitter returns to normal operation once the short is removed.

9.4.5. Transmitter-Dominant Timeout

The CA-IF1042Lx family of devices features a transmitter-dominant timeout (t_{DOM}) that prevents erroneous CAN controllers from clamping the bus to a dominant level by maintaining a continuous low TXD signal. When TXD remains in the dominant state (low) for greater than t_{DOM}, the transmitter is disabled, releasing the bus to a recessive state (see *Figure 9-3*). After a dominant timeout fault, the transmitter is re-enabled when receiving a rising edge at TXD. The transmitter-dominant timeout limits the minimum possible data rate to 4kbps.

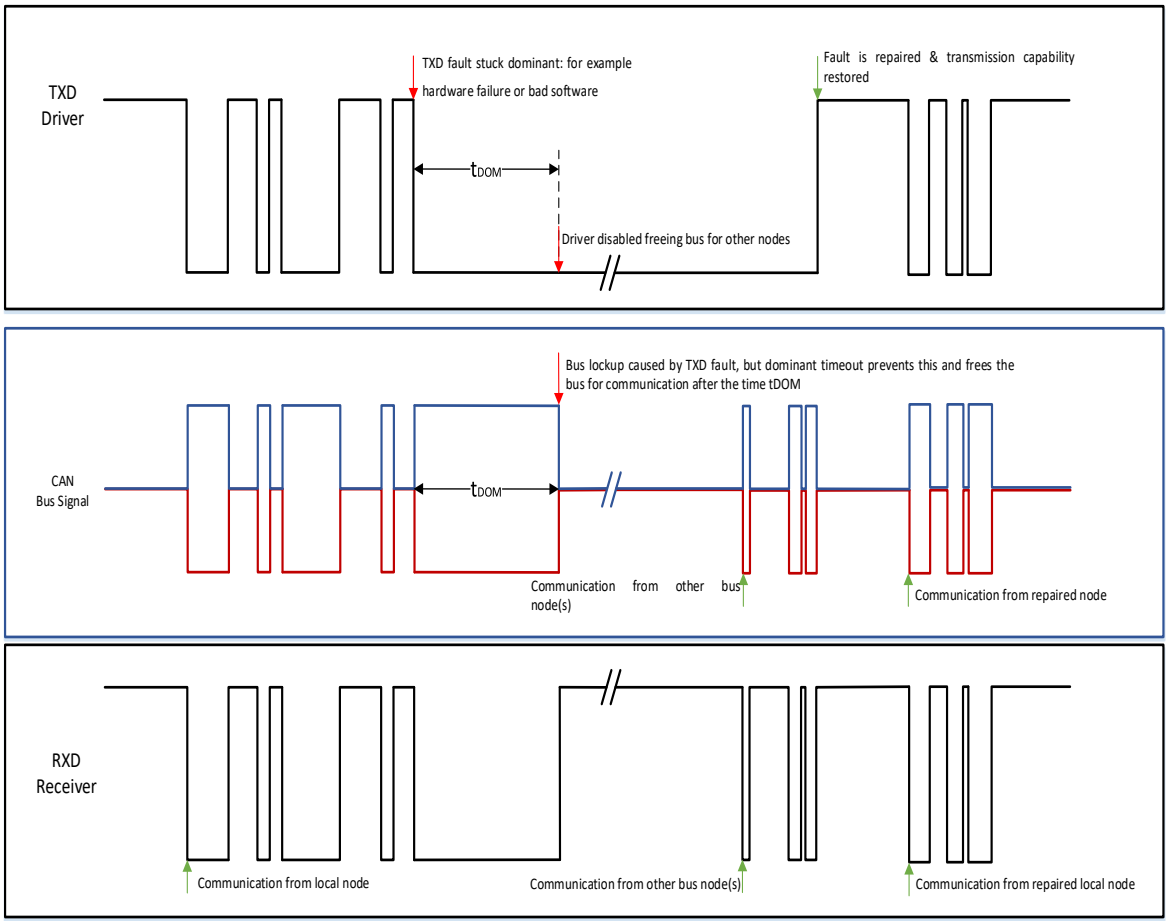

Figure 9-3 Transmitter-Dominant Timeout Protection

9.4.6. Unpowered Device

The device is designed to be 'ideal passive' or 'no load' to the CAN bus if it is unpowered. The bus terminals (CANH, CANL) have extremely low leakage currents when the device is unpowered to avoid loading down the bus.

9.4.7. Floating Terminals

These devices have internal pull-up on critical terminals to place the device into known states if the terminals float. The TXD terminal is pulled up to V_{CC} or V_{IO} to force a recessive input level if the terminal floats. The pin STB is also pulled up to force the device into standby mode if the terminal floats.

9.5. Operating Mode

All devices have two operating modes: normal mode and standby mode. Operating mode selection is made via the STB input.

9.5.1. Normal Mode

Select the normal mode of devices operation by setting STB terminal to logic-low. The CAN driver and receiver are fully operational and CAN communication is bi-directional. The driver translates a digital input on TXD to a differential output on CANH and CANL. The receiver translates the differential signal from CANH and CANL to a single-ended output on RXD.

9.5.2. Standby Mode

Drive STB pin high or leave it open for standby mode, which switches the transmitter off and disables the main receiver. The low-power receive channel is enabled and put the device to a low current and low-speed state. Thus the supply current is reduced during standby mode. The bus line is monitored by a low-power differential comparator to detect and recognize a wakeup event on the bus line, see *Table 9-5*.

Table 9-5 Operating Mode

STB	MODE	DRIVER	RECEIVER
Low	Normal	Enabled	Enabled
High or open	Standby	Disabled	Low-power receive channel is enabled and monitor the bus line.

To improve the system operation reliability and to prevent false wake-up, the CA-IF1042Lx devices' receiver features wake-up timeout detection and filtered dominant wake-up detection according to the ISO 11898-2:2016 standard. This means, for a dominant or recessive to be considered, the bus must be kept in that state for more than the t_{WK_FILTER} time. Also, for a remote wake-up event to successfully occur, a dominant bus level greater than t_{WK_FILTER} must be detected and received by the low-power receive channel within the timeout value $t \le t_{WK\_TIMEOUT}$. Once the low-power receive channel detects a successful wake-up event, RXD pulls low. CAN controller can drive the STB low based on this wake-up signal from RXD for normal operation. RXD is high until a valid wake-up is received during standby mode, see Figure 9-4 for more details.

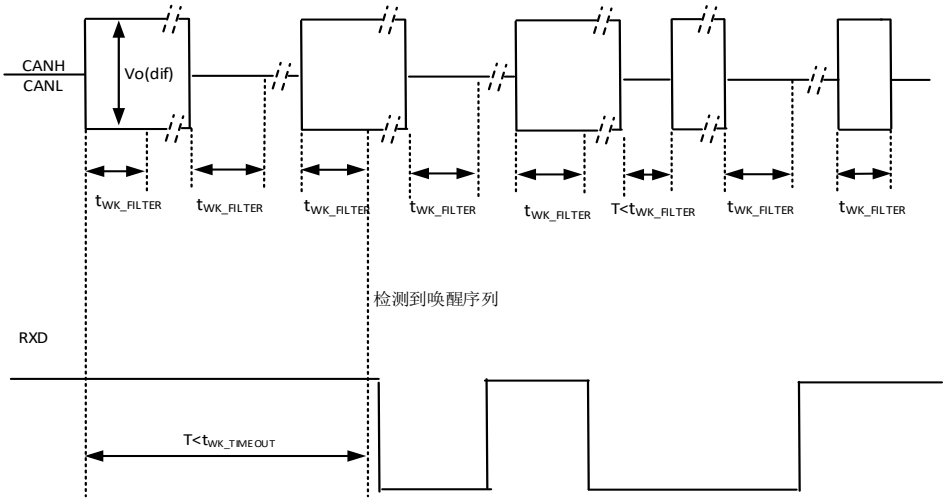

Figure 9-4 Wake-up Detection

10. Application Information

The CA-IF1042Lx CAN transceivers are typically used in applications with a host microprocessor or FPGA that includes the data link layer portion of the CAN protocol. Figure 10-1, Figure 10-2 show the typical application circuit for the CA-IF1042LS-Q1 and CA-IF1042LVS-Q1, in Figure 10-2, connect the V_{IO} to the MCU logic-supply.

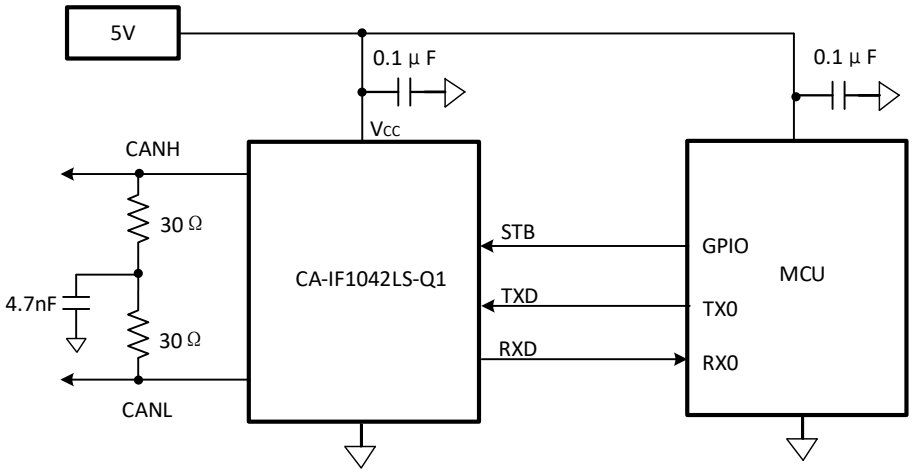

Figure 10-1 Typical Application Circuit for the CA-IF1042LS-Q1

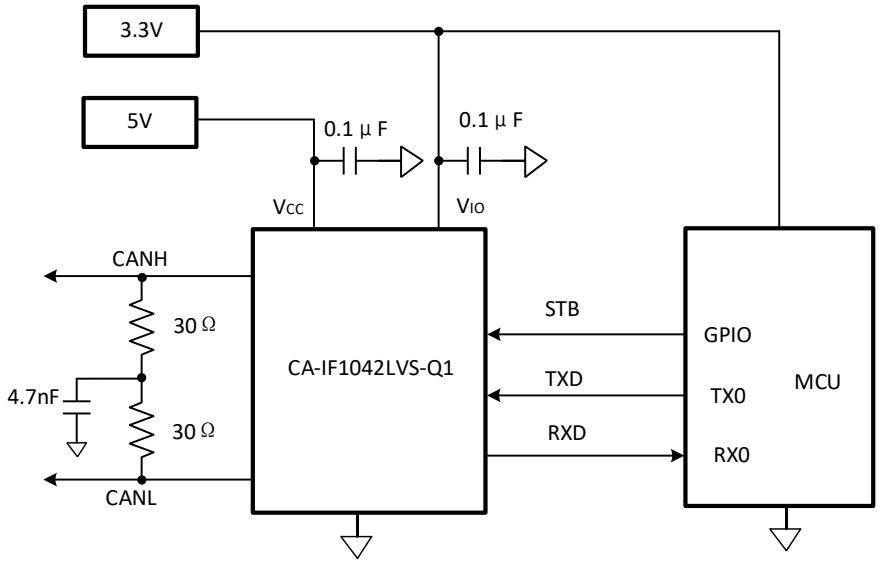

Figure 10-2 Typical Application Circuit for the CA-IF1042LVS-Q1

All of the CA-IF1042Lx series devices can operate up to 5Mbps data rate. However, the maximum data rate is limited by the bus loading, number of nodes, cable length etc. For CAN network design, margin must be given for signal loss across the system and cabling, parasitic loadings, timing, network imbalances, ground offsets and signal integrity thus a practical maximum data rate, number of nodes often lower. The ISO11898 Standard specifies a maximum of 30 nodes. However, with careful design, and consider of high input impedance of the CA-IF1042Lx, designers can have many more nodes on the CAN bus.

In multidrop CAN applications, it is important to maintain a single linear bus of uniform impedance that is properly terminated at each end. A star, ring, or tree configuration should never be used. Any deviation from the end-to-end wiring scheme creates a stub. High-speed data edges on a stub can create reflections back down to the bus. These reflections can cause data errors by eroding the noise margin of the system. Although stubs are unavoidable in a multidrop system, care should be taken to keep these stubs as short as possible, especially when operating with high data rates. See *Figure 10-3*, the typical CAN bus operating circuit, termination can be used to absorb reflections. Termination may be a single 120Ω resistor at the end of the bus, either on the cable or in a terminating node; or split termination, the two 60Ω termination resistors in parallel may be used if filtering and stabilization of the common mode voltage of the bus is desired.
