## 1 Summary

Chipanalog product quality and reliability test is a risk mitigation process designed to ensure the lifetime of device in customer application. There are a variety of methods for evaluating semiconductor wafer fabrication process and package-level reliability, which may include accelerated environmental test conditions followed by reduction to actual use conditions. The manufacturability assessment of chips includes verifying a robust assembly process, continuity of product production, and ensuring availability. According to the AEC-Q100 standards and procedures, the product evaluation of Chipanalog conforms to industry standard test methods.
