

# CA-IS373x High-Speed Triple-Channel Digital Isolators

## 1. Features

- **Data Rate: DC to 150Mbps**
- **Robust Galvanic Isolation of Digital Signals**
  - High lifetime: >40 years
  - Up to 5000  $V_{RMS}$ (wide body packages) isolation rating
  - $\pm 150$  kV/ $\mu$ s typical CMTI
- **Accepts 2.5V to 5.5V Supply Range**
- **Wide Operating Temperature Range: -40°C to 125°C**
- **Schmitt Trigger Inputs**
- **Enable Control Input with Internal Pull-up**
- **Default Output *High* (CA-IS373xH) and *Low* (CA-IS373xL) Options**
- **No Start-Up Initialization Required**
- **Low Power Consumption**
  - 1.5mA per channel @ 1Mbps,  $V_{DD\_} = 5.0V$
  - 6.6mA per channel @ 100Mbps,  $V_{DD\_} = 5.0V$
- **Best in Class Propagation Delay and Skew**
  - 12ns typical propagation delay
  - 2ns propagation delay skew (chip -to-chip)
  - 1ns pulse width distortion
  - 5ns minimum pulse width
- **Package Options**
  - Narrow-body SOIC16-NB(N) package
  - Narrow-body SSOP16-NB(B) package
  - Wide-body SOIC16-WB(W) package
- **Safety Regulatory Approvals**
  - VDE 0884-17 isolation certification
  - UL According to UL1577
  - IEC 62368-1, IEC 61010-1, GB 4943.1-2011 and GB 8898-2011 certifications

## 2. Applications

- Industrial Automation
- Motor Control
- Medical Systems
- Isolated Power Supplies
- Solar Inverters
- Isolated SPI, RS485, CAN
- Automobile

## 3. General Description

The CA-IS373x devices are high-performance triple-channel digital isolators with up to 3.75kV<sub>RMS</sub> (narrow-body package) or 5kV<sub>RMS</sub> (wide-body package) isolation rating and DC to 150Mbps ultra-fast data rate. The CA-IS373x devices offer high electromagnetic immunity and low emissions at low power consumption while isolating different ground domains and block high-voltage/high-current transients from sensitive or human interface circuitry. Each isolation channel has a logic input and output buffer separated by capacitive silicon dioxide (SiO<sub>2</sub>) insulation barrier, the integrated Schmitt trigger on each input provide excellent noise immunity.

The CA-IS3730 features 3 channels transferring digital signals in one direction for applications such as isolated digital I/Os. The CA-IS3731 device has 2 forward and 1 reverse-direction channels. All of the devices in this family come with enable pins which can be used to put the outputs in high impedance for multi-master driving applications to reduce power consumption. When the input is either not powered or is open-circuit, the default output is low for devices with suffix L and high for devices with suffix H, see the *Ordering Information* for suffixes associated with each option.

The CA-IS373x family devices are specified over the -40°C to +125°C operating temperature range. Both CA-IS3730 and CA-IS3731 are available in 16-pin SOIC narrow body package and 16-pin SOIC wide body package. Also, the CA-IS3731 provides 16-pin SSOP narrow body package.

### Device information

Part number	Package	Package size (NOM)
CA-IS3730	SOIC16-NB (N)	9.90 mm × 3.90 mm
CA-IS3731	SOIC16-WB(W)	10.30 mm × 7.50 mm
CA-IS3731	SSOP16-NB(B)	4.90 mm × 3.90 mm

### Simplified Channel Structure

GND A and GND B are the isolated grounds for A side and B side respectively.

### 5. Revision History

Revision Number	Description	Page Changed
Version 1.0	N/A	N/A
Version 1.01	Changed VIORM to 1414V, changed VIOWM AC RMS value to 1000V and DC value to 1414V. Updated Power Ratings table.	7,11, 12, 13
Version 1.02	Added CA-IS3731LB part.	2
Version 1.03	Changed VIT+(IN) minimum value to 2.0V, changed VIT-(IN) maximum value to 0.8V; removed VI(HYS).	9
Version 1.04	The VIT+(IN) description is changed to input threshold logic high, and the VIT-(IN) description is changed to input threshold logic low.	9
Version 1.05	Update VDE certification information	8

## 6. Pin Configuration and Functions

Figure 6-1. CA-IS373x pin configuration

Table 6-1. CA-IS373x pin description and function

16-SOIC/16-SSOP Pin#		Name	Type	Description
CA-IS3730	CA-IS3731			
1	1	VDDA	Supply	Power supply for side A.
2, 8	2, 8	GNDA	Ground	Ground reference for side A.
3	3	VI1	Digital I/O	Digital input 1 on side A, corresponds to logic output 1 on side B.
4	4	VI2	Digital I/O	Digital input 2 on side A, corresponds to logic output 2 on side B.
5	12	VI3	Digital I/O	Digital input 3 on side A/B, corresponds to logic output 3 on side B/A.
6, 7	6	NC <sup>1</sup>	No Connect	Not internally connected. They can be left floating, tied to VDDA or tied to GNDA.
-	7	ENA <sup>2</sup>	Digital I/O	Output enable A. Output pin on side A is enabled when ENA is high or floating; Output pin on side A is open and in high-impedance state when ENA is low.
9, 15	9, 15	GNDB	Ground	Ground reference for side B.
11	11	NC <sup>1</sup>	No Connect	Not internally connected. They can be left floating, tied to VDDB or tied to GNDB.
10	10	ENB <sup>2</sup>	Digital I/O	Output enable B. Output pin on side B is enabled when ENB is high or floating; Output pin on side B is open and in high-impedance state when ENB is low.
12	5	VO3	Digital I/O	Digital output 3 on side B/A, VO3 is the logic output for the VI3 input on side A/B.
13	13	VO2	Digital I/O	Digital output 2 on side B, VO2 is the logic output for the VI2 input on side A.
14	14	VO1	Digital I/O	Digital output 1 on side B, VO1 is the logic output for the VI1 input on side A.
16	16	VDDB	Supply	Power supply for side B.

**Notes:**

- No Connect. These pins are not internally connected. They can be left floating, tied to VDD\_ or tied to GND.
- Enable inputs ENA and ENB can be used to put the respective outputs in high impedance for multi master driving applications, external clock synchronization etc. With internal pull-up resistors, these pins can be connected to logic high or left floating to enable the outputs. If ENA, ENB are unused, it is recommended to connect these pins to a logic level, especially in the noisy environment.

## 7. Specifications

### 7.1. Absolute Maximum Ratings<sup>1</sup>

Parameters		Minimum value	Maximum value	Unit
$V_{DDA}, V_{DDB}$	Power supply voltage <sup>2</sup>	-0.5	7.0	V
$V_{IN}$	Voltage at $V_{Ix}, VO_x, EN_x$	-0.5	$V_{DD} + 0.5$ <sup>3</sup>	V
$I_O$	Output current	-20	20	mA
$T_J$	Junction temperature		150	°C
$T_{STG}$	Storage temperature range	-65	150	°C

**Notes:**

- The stresses listed under “Absolute Maximum Ratings” are stress ratings only, not for functional operation condition. Exposure to absolute maximum rating conditions for extended periods may cause permanent damage to the device.
- All voltage values are with respect to the local ground terminal (GNDA or GNDB) and are peak voltage values.
- Maximum voltage must not be exceed 7 V.

### 7.2. ESD Ratings

		Numerical value	Unit
$V_{ESD}$ Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins <sup>1</sup>	±6000	V
	Charged device model (CDM), per JEDEC Specification JESD22-C101, all pins <sup>2</sup>	±2000	V

**Notes:**

- Per JEDEC document JEP155, 500V HBM allows safe manufacturing of standard ESD control process.
- JEDEC document JEP157, 250V HBM allows safe manufacturing of standard ESD control process.

### 7.3. Recommended Operating Conditions

**8. Parameter Measurement Information**

**Notes:**

1. A square wave generator provide V<sub>IN</sub> input signal with characteristics: frequency ≤100kHz, 50% duty cycle, t<sub>r</sub> ≤3ns, t<sub>f</sub> ≤3ns, Z<sub>out</sub> = 50Ω. At the input, 50Ω resistor is required to terminate input generator signal. It is not needed in actual application.
2. C<sub>L</sub> = 15pF and includes external circuit (instrumentation and fixture etc.) capacitance. Since the load capacitance influence the output rising time, it's a key factor in the timing characteristic measurement.

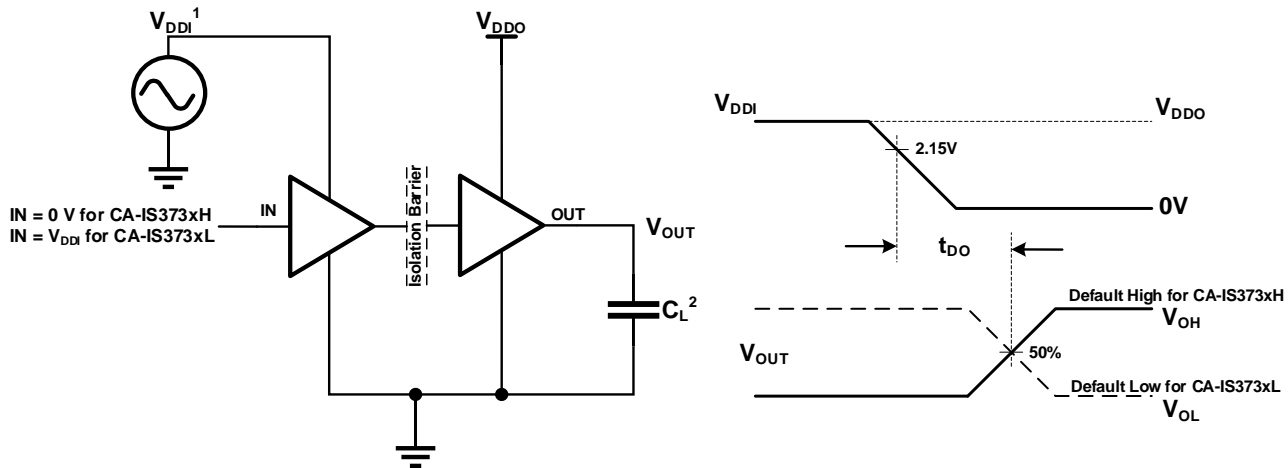

**Figure 8-1. Switching Characteristics Test Circuit and Voltage Waveforms**

**Notes:**

1. A square wave generator provide  $V_{IN}$  input signal with characteristics: frequency  $\leq 10\text{kHz}$ , 50% duty cycle,  $t_r \leq 3\text{ns}$ ,  $t_f \leq 3\text{ns}$ ,  $Z_{out} = 50\Omega$ . At the input,  $50\Omega$  resistor is required to terminate input generator signal. It is not needed in actual application.
2.  $C_L = 15\text{pF}$  and includes external circuit (instrumentation and fixture etc.) capacitance. Since the load capacitance influence the output rising time, it's a key factor in the timing characteristic measurement.

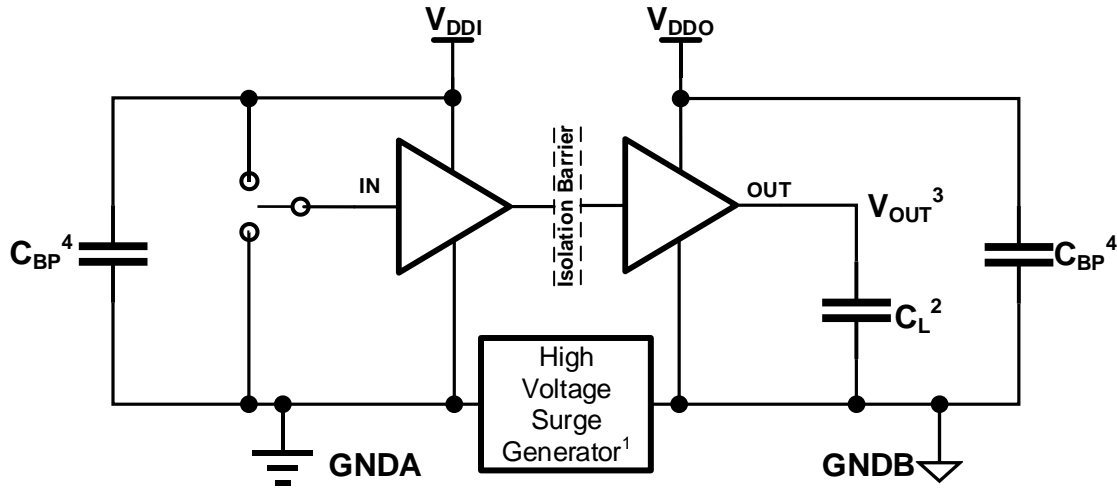

**Figure 8-2. Enable/Disable Propagation Delay Time Test Circuit and Waveform**

**Notes:**

1. Power Supply Ramp Rate =  $10\text{ mV/ns}$ .  $V_{DDI}$  should ramp over  $2.375\text{V}$ , and less than  $5.5\text{V}$ .
2.  $C_L = 15\text{pF}$  and includes external circuit (instrumentation and fixture etc.) capacitance. Since the load capacitance influence the output rising time, it's a key factor in the timing characteristic measurement.

**Figure 8-3. Default Output Delay Time Test Circuit and Voltage Waveforms**

**NOTE:**

1. The High Voltage Surge Generator generates repetitive high voltage surges with > 1kV amplitude, rise time <10ns and fall time <10ns, to reach common-mode transient noise with > 150kV/μs slew rate.
2.  $C_L = 15\text{pF}$  and includes external circuit (instrumentation and fixture etc.) capacitance.
3. Pass-fail criteria: the output must remain stable.
4.  $C_{BP}$  (0.1 ~ 1μF) is bypass capacitance.

**9. Detailed Description**

**9.1. Overview**

The CA-IS373x are a family of three-channel digital galvanic isolators using Chipanalog’s full differential capacitive isolation technology. These devices have an ON-OFF keying (OOK) modulation scheme to transfer digital signals across the SiO2 based isolation barrier between circuits with different power domains. The transmitter sends a high frequency carrier across the barrier to represent one digital state and sends no signal to represent the other digital state. The receiver demodulates the signal and recovers input signal at output through a buffer stage. With this OOK architecture, CA-IS373x family of devices build a robust data transmission path between different power domains, without any special start-up initialization requirements. If the ENx pin is low then the corresponding output goes to high impedance. These devices also incorporate advanced full differential techniques to maximize the CMTI performance and minimize the radiated emissions due the high frequency carrier and IO buffer switching.

**9.2. Functional Block Diagram**

The conceptual block diagram of a digital capacitive isolator, Figure 9-1, shows a functional block diagram of a typical channel; Figure 9-2 shows the operating waveform of a typical channel.

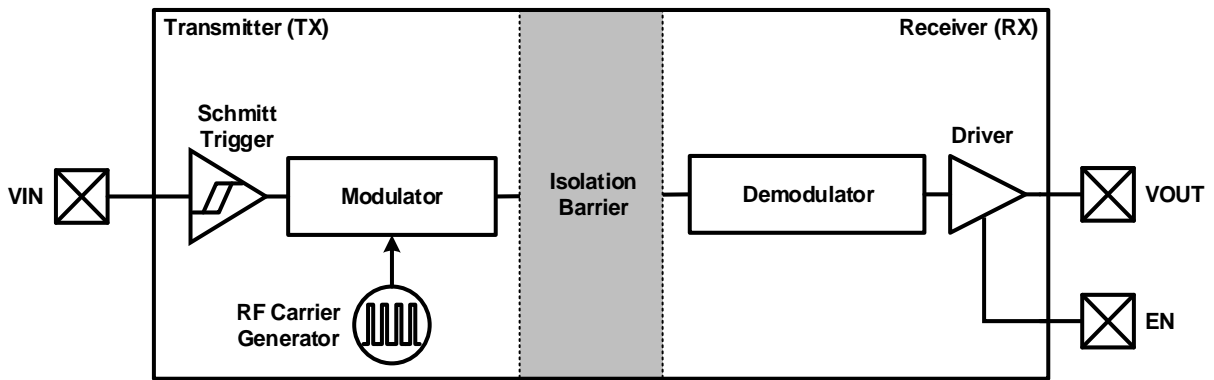

Figure 9-1. Functional Block Diagram of a Single Channel

Figure 9-2. Conceptual Operation Waveforms of a Single Channel

**9.3. Device Operation Modes**

Table 9-1 lists the operation modes for the CA-IS373x devices.

**Table 9-1. Operation Mode Table**

$V_{DDI}^1$	$V_{DDO}^1$	INPUT ( $V_{Ix}$ ) <sup>2</sup>	ENABLE ( $EN_x$ ) <sup>3</sup>	OUTPUT ( $VO_x$ )	OPERATION
PU	PU	H	H or open	H	Normal operation mode: A channel output follows the logic state of its input.
		L	H or open	L	
		Open	H or open	Default	Default output mode: When input $V_{Ix}$ is open, the corresponding channel output goes to its default logic state. Default is <i>High</i> for CA-IS373xH and <i>Low</i> for CA-IS373xL.
X	PU	X	L	Z	High impedance mode: A low level of Enable pin causes the output to be high impedance.
PD	PU	X	H or open	Default	Default output mode: When $V_{DDI}$ is unpowered, a channel output assumes the logic state based on its default option. Default is <i>High</i> for CA-IS373xH and <i>Low</i> for CA-IS373xL.
X	PD	X	X	Undetermined	If the output side $V_{DDO}$ is unpowered, a channel output is undetermined. <sup>4</sup>

**Notes:**

- $V_{DDI}$  = Input-side  $V_{DD}$ ;  $V_{DDO}$  = Output-side  $V_{DD}$ ; PU = Powered up ( $V_{DD} \geq V_{DD(UVLO+)}$ ); PD = Powered down ( $V_{DD} \leq V_{DD(UVLO-)}$ ); X = Irrelevant; H = High level; L = Low level; Z = High Impedance.
- A strongly driven input signal can weakly power the floating  $V_{DD}$  through an internal protection diode and cause undetermined output.
- It is recommended to connect the enable inputs to external logic high or low level when the CA-IS373x operates in noisy environments.
- The outputs are in undetermined state when  $V_{DD(UVLO+)} < V_{DDI}$ ,  $V_{DDO} < V_{DD(UVLO-)}$ .

Table 9-2 is the truth table with Enable input for the CA-IS373x devices.

**Table 9-2. Enable Control**

PART NUMBER	ENA <sup>1,2</sup>	ENB <sup>1,2</sup>	STATUS
CA-IS3730	—	H	B-side outputs $VO_1$ , $VO_2$ , $VO_3$ are enabled and each output follows the logic state of its input.
	—	L	B-side outputs $VO_1$ , $VO_2$ , $VO_3$ are disabled, and go to high impedance state.
CA-IS3731	H	X	A-side output $VO_3$ is enabled and follows the logic state of its input.
	L	X	A-side output $VO_3$ is disabled and goes to high impedance state.
	X	H	B-side outputs $VO_1$ , $VO_2$ are enabled and each output follows the logic state of its input.
	X	L	B-side outputs $VO_1$ , $VO_2$ are disabled and go to high impedance state.

**Notes:**

- Enable inputs ENA and ENB can be used to put the respective outputs in high impedance for multi master driving applications, external clock synchronization etc. With internal pull-up resistors, these pins can be connected to logic high or left floating to enable the outputs. If ENA, ENB are unused, it is recommended to connect these pins to a logic level, especially in the noisy environment.
- X = Irrelevant; H = High level; L = Low level.

**10. Application and Implementation**

Isolation ICs provide complete galvanic isolation between two power domains, protecting circuits from high common-mode transients and faults and eliminating ground loops. In many applications, digital isolators are replacing optocouplers because they can reduce the power requirements and take up less board space while offering the same isolation capability. The CA-IS373x devices are the high-performance, triple-channel digital isolators. These devices come with enable pins on each side which can be used to put the respective outputs in high impedance for multi master driving applications. Unlike optocouplers, which require external components to improve performance, provide bias, or limit current, the CA-IS373x devices only require two external bypass capacitors to operate. To reduce ripple and the chance of introducing data errors, bypass  $V_{DDA}$  and  $V_{DDB}$

pins with 0.1μF to 1μF low-ESR ceramic capacitors to GNDA and GNDB, respectively. Place the bypass capacitors as close to the power supply input pins as possible. Figure 10-1 shows typical operating circuit of the CA-IS3731.
